

Pneumatic Seals

We have developed a series of Polyurethane sealing material, with low starting pressure, high sealing performance and long service life, for pneumatic cylinder.

Low starting pressure; High sensitivity; Self-lubricating material;
High rebound characteristics; High sealing performance.

Compression set: $\leq 22\%$

Good wear resistance; Long service life.

Special structural design:

Thin sealing lip design helps reduce the contact pressure between the seal and cylinder, and meets the requirement of low starting pressure and high sensitivity.

Circular sealing lip design helps ensure the lubricated of sliding surface, and meets the requirement of high sealing performance and long service life.

Compact-sized sealing lip design that is good for cylinder space saving and cost saving.
